

Updates 26_17
Version 2.7.5.10

This version has some bug fixes and a couple of enhancements.

Wells imported using a previous version with an undefined well type did not display in the Stack and Cross-Section Viewers. The problem was that the color assigned to 'no well type' was transparent. Now those wells with no well type will be displayed in black in the Stack and Cross-Section Viewers.

The 3D Viewer: Fixed missing update when changing the fault display colors. Each fault can now have a unique color. The Viewer now allows full rotation so that one can view horizons, etc from the bottom up.

In the map viewer, you now have more options for geolines (lat-long). To access, click on the gear icon on the Map Viewer menu bar, and choose the spacing for the geolines. You can choose to label them as either decimal degrees or degrees, minutes, seconds and can change the width of the lines and the annotation size.
